Code Maintainability and Network Reliability of Godef and it's Dependencies #368

New issue

Open

razic opened this issue 23 days ago · 4 comments

razic commented 23 days ago

This is a discussion topic to help ensure `vim-go` users have a smooth installation when running `GoInstallBinaries`.

Right now, if you try to run `vim +PluginInstall +GoInstallBinaries +qall` you'll exit with a timeout error. The problem is that <https://github.com/rogppe/godef> imports code from a `go` library hosted on <http://9fans.net> which has been down for at least 2 days.

I also noticed that `godef` itself moved from Google Code to GitHub recently. All the network issues and maintainability problems scare me a little.

Fortunately for us, the 9fans guys seem to have made the same move from Google Code to Github, although perhaps undisclosed. So the code is actually available to download on GitHub at <https://github.com/9fans/go>. However, they made the same mistake as `godef`, and the `go` files in their library continue to import from <http://9fans.net>.

Is there any alternative solutions to `godef` that is more actively maintained?

In the meantime, I get around this by installing <https://github.com/9fans/go> using `git` instead of `go get`. This allows me to set the file path location for the downloaded code, appearing to `go` as if it were downloaded directly from <http://9fans.net>.

The workaround:

thanks razic for your workaround!

fatih commented 22 days ago

Owner

Hi @razic. Thanks for the wonderful workaround and notification, really appreciated.

There is currently an open issue on Godef which deals with the same problem: [rogpeppe/godef#4](#)

Let's wait a little bit if this can be resolved either by their respective authors or contributions from outside. If there is no solution we can always create a repository here on Github and point vim-go to use it until there is a fix.

fatih commented 22 days ago

Owner

Furthermore, we may want to discuss a more robust binary installation algorithm for the GoInstallBinaries command that takes network errors into account, and perhaps even providing alternative download links.

I have the github.com/vim-go accounts just for these future purposes. It can be used later in the future to have vendored versions (go packages) of all necessary binaries/commands needed by vim-go. However it would introduce another step in my life that I need to maintain. I'm doing this all on my spare times and honestly I don't have that much time and the current approach works real well expect in those situations when the package moves, etc.. I'm always in favor of simplicity and don't try to introduce complex things into vim-go.

Lets have this issue opened until the real issue with godef is resolved. Thanks again for @razic bringing this up.
